	<p>The guideline correctly does not require companies to take into consideration spread risk in the calculation of the risk margin. However, the guidelines states that the capital projections used to calculate the RM should be determined without taking into account the LTG measures the company uses for the SCR calculations. This guideline should be reworded such that the LTG adjustments could be considered in the calculation of the risk margin, without considering spread risk in the calculation.</p> <p>The guideline also assumes that the reference undertaking buying the portfolio does not apply the LTG measures previously applied by the original undertaking, even though it is much more appropriate and a logical assumption.</p> <p>It is important to note that the OII package was negotiated and approved based on the outcome of the LTG Assessment where LTG measures were taken into account in the RM calculation.</p> <p>In their own reporting requirements in Technical Provisions Templates S.17.01.b (Non-Life Technical Provisions) and S.17.03.b (Information on the Volatility Adjustment Non-Life Obligations) – EIOPA asks for the allocation of the LTG measures impact on the Risk Margin and Best Estimate – indicating they are applied to the Risk Margin calculation.</p>
